# Work Study (Motion and Time Study) 

Dewi Hardiningtyas, ST., MT., MBA.

## WORK STUDY

(Internationall Labor Organization)

A term used to embrace the techniques of method study and work measurement, which are employed to ensure the best possible use of human and material resources in carrying out specified activity.

## WORK STUDY

(British Standard Instituite)
A generic term for those techniques, particularly 'method study' and 'work measurement', which are used in the examination of human work in all its contexts and which lead systematically to the investigation of all factors which affect the efficiency and economy of the situation being renewed, in order to effect improvement.

## Importance of Work Study

* Guidance to understand the nature and true costs of work
* Assist management in reducing unnecessary costs
* Balancing work cells to make work flow smoother
* Learn the details of work and make improvement

## History Of Work Study

## Why Labor?

A major factor in the cost of a product

LABOR PRODUCTIVITY IMPROVES

Wages Go Up
Profits Go Up
Reduced WASTES

## Eliminate Waste!

## Manual Work

(HUMAN)

## Semi-Automatic Work

## Automatic Work

FEED BACK

## PRODUCTIVITY

## DEFINITION

Productivity is what man can accomplish with material, capital and technology. Productivity is mainly an issue of personal manner. It is an attitude that we must continuously improve ourselves and the things around us

## Productivity $1 / 4$ units of output/units of input

Productivity is defined as the ratio of what is produced to what is required to produce it. Productivity measures the relationship between output such as goods and services produced, and inputs that include labour, capital, material and other resources

Productivity means how much and how well we produce from the resources used. If we produce more or better goods from the same resources, we increase productivity. Or if we produce the same goods from lesser resources, we also increase productivity. By "resources", we mean all human and physical resources, i.e. the people who produce the goods or provide the services, and the assets with which the people can produce the goods or provide the services

Productivity is the ability to satisfy the market's need for goods and services with a minimum of total resource consumption

## Efficiency, Effectiveness, And Productivity

## DEFINITION of EFFICIENCY

## DEFINITION of EFFECTIVENESS

Efficiency is a measure of how economically

| the firm's resources are utilised when | Effectiveness refers to the extent to which |
| :--- | :--- |
| providing the given level of customer | the customer requirements are met |
| satisfaction |  |
| do the things right | do the right things |

$$
\begin{aligned}
& \text { produktivitas }=\frac{\text { output yang dihasilkan }}{\text { input yang dikeluarkan }} \\
& \text { produktivitas }=\frac{\text { hasil yang sukses dicapai }}{\text { sumber daya yang dikonsumsi }} \\
& \text { produktivitas }=\frac{\text { efektivitas }}{\text { efisiensi }}
\end{aligned}
$$

## Productivity Improvement Strategy

## Work Study-Analysis-Design

## Methods Study

- To improve methods of production
- Designed to determine the best way to complete a repetitive job

Resulting in more effective use of material, manpower, machine and methods plant and equipment working environments

## Work Measurement

- To assess human effectiveness
- Measures how long it takes a worker to complete a task at a normal pace

Making possible improved planning and control manning and as a basis for sound incentives schemes

## Methods Study

## Purposes of Methods Study

## Importance of Methods Study

Changes in tools and equipment.

Changes in product design or new products.

Changes in materials or procedures.

Other factors (e.g. accidents, quality problems).

## Document and Analyze Present Method

- Obtain production requirements.
- Procure engineering data.
- Procure manufacturing and cost data.
- Description and sketches of work station and tools.
- Use process chart, e.g. assembly chart, flow process chart, flow diagram, worker-machine activity chart, etc.

INSPECTION: indicates a check for quality or quantity

TRANSPORT: the movement of workers, materials or equipment

STORAGE: controlled storage in which material is received into or issued from a store, or an item is retained for reference purposes

DELAY or TEMPORARY STORAGE: indicates a delay in the process, or an object laid aside until required

## Process Chart

- Process Charts are a form of workflow/ working process/ systems/ procedures charting to record the essential features of a work situation for subsequent analysis.
- The different kinds of process chart share a common core set of symbols (five), were first promulgated by the American Society of Mechanical Engineers (ASME).
- Process charts have been designed to meet the needs of a particular level or stage of analysis :
- At a detailed level (recording activity at a specific work station or workplace), or MICRO-LEVEL PROCESS CHART.
- At the wider system, process, or procedure level (MACROLEVEL PROCESS CHART)

## Classification of Process Chart

## Operation Process Chart (OPC)

- The OPC shows the chronological sequence of all operations, inspections, time allowances, and materials used in a manufacturing or business process, from the arrival of raw material to the packaging of the finished product.
- The OPC depicts the entrance of all components and subassemblies to the main assembly.
- Two symbols are used in constructing the OPC : an operation and an inspection.

Oparation Process Chart

Charred By B.W.N. + 12 .

## Flow Process Chart (FPC)

- The flow process chart is a device for recording a process in a compact manner, as a means of better understanding it and improving it.
- The chart represents graphically the separate steps or events that occur during the performance of a task or doing a series of actions.
- The chart usually begins with the raw material entering the factory and follows it through every step.
- FPC uses all (five) symbols of ASME.

| Flow Process Chart Job: Requisition of petty cash |  |  | nalyst <br> ABC | $\begin{aligned} & \text { Page } \\ & 1 \text { of } 2 \end{aligned}$ | Operation | Movement | Inspection | Delay | Storage | Distance |

| Delays | 1 |  |  |  |  |  |  |  |  |  |
| Total | 11 |  |  |  |  |  |  |  |  |  |

## Flow Diagram (FD)

- A pictorial representation of the layout of floors and buildings, showing the locations of all activities on the flow process chart, is a flow diagram.
- The flow diagram is a helpful supplement to the flow process chart because it indicates backtracking and possible traffic congestion areas, and it facilitates developing an idea plant layout.

MATERLALS FLOW \& PRODUCT FLOW

## Man-Machine Chart

- The Man-Machine Chart is used to study, analyze, and improve one workstation at a time.
- The chart shows the exact time relationship between the working cycle of the person and operating cycle of the machine.
- These facts can lead to utilization of both worker and machine time, and a better balance of the work cycle.
- The utilization of this idle time can increase operator earnings and improve production efficiency.

| Summary |  |  |  |
| :--- | :---: | :---: | :---: |
|  | Customer | Clerk | Coffee grinder |
| Idle time | 48 sec. | 21 sec. | 49 sec. |
| Working time | 22 | 49 | 21 |
| Total cycle time | 70 | 70 | 70 |
| Utilization in percent | Customer utilization $=$ <br> $\frac{22}{70} \approx 31 \%$ | Clerk utilization $=$ <br> $\frac{49}{70}$$=70 \%$ |  | | Machine utilization $=$ |
| :---: |
| $\frac{21}{70}=30 \%$ |

## Gang Process Chart

- The Gang Process Chart is an adaptation of the worker and machine process chart.
- The gang process chart shows the exact relationship between the idle and operating cycle of the machine and the idle and operating times per cycle of the workers who service that machine.
- This chart reveals the possibilities for improvement by reducing both idle operator time and idle machine time.

## Left-Right Hand Chart

- The Left-Right Hand (Operator) Chart is used to show the activities/motions of operator's hand during work, e.g. repetitive assembly.
- The purpose is to eliminate unnecessary motion, known as motion economy.

Standing: male and fernale

## Work (Time) Measurement

## Work (Time) Measurement

- Why is time of work?
$\checkmark$ to determine manpower requirements and capacity limitations.
$\checkmark$ an objective way to compare alternative methods for accomplishing the same task.
$\checkmark$ a basis for wage incentives and for evaluating worker performance.
$\checkmark$ time data for production planning and scheduling, cost estimating, material requirements planning.
- Definition of Work Measurement / Time Study : techniques that are concerned with the evaluation of a task in terms of the time that should be allowed for an average worker to perform that task.
- Objective : to determine a standard time for the task.

## Prerequisites For Valid Time Standards

- The standard time for a given task is the amount of time that should be allowed for an average worker to process one unit using the standard method and working at a normal pace.
- As a prerequisite for establishing a standard time for a task, all of these factors must be standardized. The standardized factors are the following:
- The task is performed by an average qualified worker
- The worker's pace (speed) represents standard performance
- The worker uses the standard method
- The task is performed on a standard output unit that is defined before and after processing.

## When Are Time Standards Beneficial?

How does an organization know whether it needs time standards for its operations?

The following characteristics are typical of industrial situations in which time standards would be beneficial:
\& Low productivity. If the current level of productivity is low.

* Repeat orders. Once the time standard is set during the first order, the same standard can be used for successive orders.
* Long production runs. Means that the time invested to set the standard is assigned over more parts.
* Repetitive work cycles. When the work cycle is highly repetitive.
* Short cycle times. Short work cycles require less time to set standards.

## Methods to Determine Time Standards

## - Estimation

- The department foreman or other person familiar with the jobs performed in the department is asked to judge how much time should be allowed for the given task.
- Historical records of previous production runs
- In this method, the actual times and production quantities from records of previous identical or similar job orders are used to determine the time standards.
- Work Measurement (WM) techniques
- The work measurement techniques are more time consuming to implement but they are more accurate than estimation or historical records.
- Direct WM : Stopwatch (Direct) Time Study, Work Sampling
- Indirect WM : Predetermined Motion Time Systems (PMTS), Standard Data System.

The Pyramidal Structure of Work \&
WM Techniques

## Work Measurement Techniques

Work sampling
Historical records
Estimates

Poor Fair Good Very good
Relative accuracy

## Work Measurement Techniques

* Work Sampling (WS) : determine proportions of time spent in various categories of work activity using randomized observations of the subjects of interest.
\& Stopwatch Time Study (STS) : direct observation of a task using a stopwatch or other chronometric device to record the time taken to accomplish the task. The task is usually divided into work elements and each work element is timed separately.
\& Predetermined Motion Time System (PMTS) : set a standard time for a given task, lists all of the basic motions that comprise the task, and recovers the normal time for each element from the basic motion table.
* Standard Data System : a compilation of normal time values for work elements used in tasks that are performed in a given facility. The normal time values in a standard data system are usually compiled from previous direct time studies, such as PMTS, STS, WS, or even historical time records.

## General Steps to Determine Standard Time

3. Observe, measure, and record time of each elements (10 replications)
$\rightarrow$ Observation
Time
4. Record the performance rating and allowance for each operator observed (only for STS \& WS)
6. Calculate the Normal Time (affected by performance rating).
5. Evaluate data recorded, such as normality, uniformity, adequacy

## Performance rating (PR) \& Normal Time

If worker performance is expressed in terms of daily output, thus for an output of 100 pieces per day ( 480 min ) at average performance by qualified worker.

An average qualified worker is one who has acquired the skill, knowledge and other attributes to carry out the work in hand to satisfactory standards of quantity, quality and safety.

## Westinghouse Rating System

| Skill | Effort |
| :---: | :---: |
| $\begin{array}{ll} +0.15 \mathrm{~A}_{1} \text { - Superskill } & -0.05 \mathrm{E}_{1} \text { - Fair } \\ +0.13 \mathrm{~A}_{2} & -0.10 \mathrm{E}_{2} \\ +0.11 \mathrm{~B}_{1} \text { - Excellent } & -0.16 \mathrm{~F}_{1} \text { - Poor } \\ +0.08 \mathrm{~B}_{2} & -0.22 \mathrm{~F}_{2} \\ +0.06 \mathrm{C}_{1} \text { - Good } & \\ +0.03 \mathrm{C}_{2} & \\ 0.00 \mathrm{D} \text { - Average } & \end{array}$ | $\begin{array}{ll} +0.13 \mathrm{~A}_{1} \text { - Excessive } & -0.04 \mathrm{E}_{1} \text { - } \text { Fair } \\ +0.12 \mathrm{~A}_{2} & -0.08 \mathrm{E}_{2} \\ +0.10 \mathrm{~B}_{1} \text { - Excellent } & -0.12 \mathrm{~F}_{1} \text { - Poor } \\ +0.08 \mathrm{~B}_{2} & -0.17 \mathrm{~F}_{2} \\ +0.05 \mathrm{C}_{1} \text { - Good } & \\ +0.02 \mathrm{C}_{2} & \\ 0.00 \mathrm{D} \text { - Average } & \end{array}$ |
| Conditions | Consistency |
| $\begin{aligned} +0.06 & \text { A - Ideal } \\ +0.04 & \text { B - Excellent } \\ +0.02 & \text { C - Good } \\ 0.00 & \text { D - Average } \\ -0.03 & \text { E - Fair } \\ -0.07 & \text { F - Poor } \end{aligned}$ | $\begin{aligned} +0.04 & \text { A - Perfect } \\ +0.03 & \text { B - Excellent } \\ +0.01 & \text { C }- \text { Good } \\ 0.00 & \text { D - Average } \\ -0.02 & \text { E }- \text { Fair } \\ -0.04 & \text { F - Poor } \end{aligned}$ |

## Allowances in Time Standards

- Allowances are used because there will be periods during the regular work shift when the worker is not working.
- The purpose of the allowance factor is to compensate for this lost time by providing a small increment of "allowance time" in each cycle. This way, even with the time losses, the operator will still be able to complete a day's work during the hours of the shift.
- Normal time is adjusted by an $\mathbf{A}_{\text {pfd }}$ (allowance for personal time, fatigue, delay) to obtain the standard time

## Standard Time :

$\mathrm{T}_{\mathrm{STD}}=\mathrm{T}_{\mathrm{N}}\left(\mathbf{1}+\mathrm{A}_{\mathrm{pfd}}\right)$

## Standard Output :

$\mathrm{O}_{\text {STD }}=1 / \mathrm{T}_{\text {STD }}$

## PROBLEM \# 1

The average observed time for a repetitive work cycle in a direct time study was 3.27 min . The worker's performance was rated by the analyst at $90 \%$. The company uses a PFD allowance factor of $13 \%$. What is the standard time for this task?

## Solution \# 1

Normal time : $T_{N}=3.27(0.90)=2.943 \mathrm{~min}$
Standard time : $T_{\text {STD }}=2.943(1+0.13)=3.326 \mathrm{~min}$

## PROBLEM \# 2

The ABC Company uses a standard data system to set time standards. One of the time study analysts listed the three work elements for a new task to be performed in the shop and then determined the normal time values to be $0.73 \mathrm{~min}, 2.56 \mathrm{~min}$, and 1.01 min . The company uses a PFD allowance factor of $16 \%$. Determine the standard time for the task.

## Solution \# 2

Normal time : $T_{N}=0.73+2.56+1.01=4.30 \mathrm{~min}$;
Standard time : $T_{S T D}=4.30(1+0.16)=4.988 \mathrm{~min}$

## PROBLEM \# 3

Determine the personal time, fatigue, and delay (PFD) allowance to be used for computing time standards in the following situation. Second shift workers punch in at 3:30 p.m. and punch out at 12:00 midnight. They are provided one-half hour for supper at 6:00 p.m., which is not counted as part of the 8 -hour shift. For purposes of determining the allowance, 30 minutes of break time (personal time and fatigue) are allowed each worker. In addition, the plant allows 35 min for lost time due to unavoidable delays. What should the PFD allowance factor be?

## Solution \# 3

Allowance time for 30 min of break time plus 35 min for lost time $=65 \mathrm{~min}$

$$
\text { Allowance factor } A_{p f d}=480 /(480-65)-1=1.157-1=0.157
$$

= 15.7\%
